管内等熵 出口处正激波

气源 p_0 波前 波后 p_b

throat

已知: $A/A_0 = 0.5$, 空气背压 $p_b = 1 \times 10^5\text{ N/m}^2$, 在出口处恰好正激波

求: 气源滞止压力, 出口截面 (激波后) 上气体的滞止压力。

有激波, $A_1 = A^*$

A/A_0 等熵 $M_{a2} = M_1 > 1$ (波前) $\frac{p_2}{p_1} = f(M_1) \rightarrow p_1$

正激波 $p_2 = p_{shock} = p_b$ (波后) $p_1 = f(M_1) \rightarrow p_1$

3. 若 $p_0 < p^*$

- 管内流动及出口状态同上完全一样, $p_0 = p^*, M_{a0} = 1$

- 质量流量也同上, 质量阻塞/堵塞/堵塞

$M_{a1} = 2$

$M_{a2} = ?$

$\delta = 10^\circ$

Prandtl-Meyer角 θ

$$\theta = \sqrt{\frac{\gamma+1}{\gamma-1}} \arctan \sqrt{\frac{\gamma-1}{\gamma+1} (M^2 - 1)} - \arctan \sqrt{M^2 - 1}$$

θ 为气流从 $M=1$, $\theta=0$ 到 M 流动的偏转角

$M_{a1} = 2$
 查表 $\theta_1 = 26.5^\circ$ (相对 $M_{a0}=1$ 的偏转)

加速到 M_{a2} , 所以 $\theta_2 > \theta_1$, 扰动前后气流方向 $\Delta\theta = \delta = 10^\circ$

$\theta_2 = \theta_1 + \delta = 26.5^\circ + 10^\circ = 36.5^\circ$

则查表 $M_{a2} = 2.39$

整个偏转过程是加速 ($M_{a2} > M_{a1}$) 等熵膨胀增压过程

充满油的油缸内有长 L 活塞向下以 V_0 等速运动, 油通过间隙 δ 向上流动, $\delta \ll d$, 流动是层流, 已知油粘度系数 μ , 密度 ρ , 活塞上下压差 $p_2 - p_1$, 活塞直径 d , 间隙 δ , 忽略端部效应, 求 V_0 。

 $u = \frac{1}{2\mu} \frac{dp^*}{dx} y^2 + c_1 y + c_2$ 从 Couette 流通解入手
 $(u)_{y=0} = 0$
 $(u)_{y=\delta} = -V_0$
 定 c_1 和 c_2
 其中 $\frac{dp^*}{dx} = \frac{\Delta(p + \rho gh)}{L} = \frac{(p_2 + \rho gL) - p_1}{L} = \frac{p_2 - p_1}{L} + \rho g$
 积分整理后得到
 $V_0 \frac{\delta}{2} + \frac{d}{4} = -\frac{\delta^3}{12\mu L} (p_2 - p_1 + \rho gL)$
 $V_0 = \frac{\delta^3}{3\mu(2\delta + d)} \left(\frac{p_1 - p_2 - \rho gL}{L} \right) \approx \frac{\delta^3}{3\mu d L} (p_1 - p_2 - \rho gL)$

灰尘 $\rho_1 = 2500kg/m^3$, 空气 $\rho = 1.225kg/m^3, \mu = 1.825 \times 10^{-5} m^2/s$, 求符合 Stokes 公式的灰尘的最大直径和沉降速度 V_0

$\vec{F}_D = 6\mu a V_0 \vec{k} + \frac{4}{3} \rho g \pi a^3 \vec{e}_h$
 $F_D = 6\mu a V_0 + \frac{4}{3} \rho g \pi a^3 = \frac{4}{3} \rho_1 g \pi a^3$
 $6\mu a V_0 = \frac{4}{3} (\rho_1 - \rho) g \pi a^3$
 $\frac{3\mu^2 \pi 2a V_0}{\rho} = \frac{4}{3} (\rho_1 - \rho) g \pi a^3$
 $\frac{3\mu^2 \pi}{\rho} Re = \frac{4}{3} (\rho_1 - \rho) g \pi a^3$

 $V_0 = \frac{Re \mu}{\rho} = 0.055 m/s$

实际涡更接近组合涡模型

组合涡: 核中心是一个强迫涡, 在核区之外的速度分布为自由涡。

$$V_\theta = \omega r \quad r \leq r_0$$

$$V_\theta = \frac{C}{r} \quad r > r_0$$

无旋可用Bernoulli方程, 写出压力分布 $(r \geq r_0)$

有旋, 用Euler方程, $\vec{v} \cdot \nabla \vec{v} = -\frac{\nabla p}{\rho}$, $-\frac{V_\theta^2}{r} = -\frac{1}{\rho} \frac{dp}{dr}$ ($r \leq r_0$)

在交接处, 速度连续, 压力连续

可确定C和压力分布

$$C = \omega r_0^2$$

$$p = \frac{\rho \omega^2 r^2}{2} + p_\infty - \rho \omega^2 r_0^2, \quad (r \leq r_0)$$

$$p = p_\infty - \frac{1}{2} \frac{\rho \omega^2 r_0^4}{r^2} \quad (r \geq r_0)$$

2. 半无限长钝头体绕流

均匀来流

$$\varphi = U_\infty x$$

$$\psi = U_\infty y$$

点源

$$\varphi = \frac{Q}{2\pi} \ln r$$

$$\psi = \frac{Q}{2\pi} \theta$$

$$\varphi = U_\infty r \cos \theta + \frac{Q}{2\pi} \ln r = U_\infty r \cos \theta + U_\infty b \ln r$$

$$\psi = U_\infty r \sin \theta + \frac{Q}{2\pi} \theta = U_\infty r \sin \theta + U_\infty b \theta$$

$$V_r = \frac{\partial \varphi}{\partial r} = U_\infty \cos \theta + \frac{Q}{2\pi r}$$

$$V_\theta = \frac{1}{r} \frac{\partial \varphi}{\partial \theta} = -U_\infty \sin \theta$$

分析:

• 驻点位置 $V_r = U_\infty \cos \theta + \frac{Q}{2\pi r} = 0$
 $V_\theta = -U_\infty \sin \theta = 0 \Rightarrow \theta = \pi, r = \frac{Q}{2\pi U_\infty} = b$ 即 $(-b, 0)$

驻点处流函数值 $\psi_0 = \pi b U_\infty$

过驻点的流线方程 $\psi = U_\infty r \sin \theta + \frac{Q}{2\pi} \theta = \pi b U_\infty$

由此得到过驻点的流线形状 $r = \frac{b(\pi - \theta)}{\sin \theta}$

$$\theta \rightarrow 0, y = \pi b; \quad \theta \rightarrow 2\pi, y = -\pi b;$$

过驻点流线 $r = \frac{b(\pi - \theta)}{\sin \theta}$, 或 $y = b(\pi - \theta)$ 可看做固体边界

2. 水以 1.5m/s 均匀流过一平面壁，泵从一缝隙中以 $Q=0.01\text{m}^3/\text{s}$ (单位宽度) 的流量抽吸壁面的水，求驻点位置；求过驻点的流线方程；问距离壁面 $H=?$ 多远的流体不会被吸入缝隙中？

解：均匀流+点汇的例子（解叠加，等流函数为流线，流函数之差为流量）

$$\varphi = U_\infty x - \frac{Q}{\pi} \ln \sqrt{x^2 + y^2}, \quad \psi = yU_\infty - \frac{Q}{\pi} \arctg \frac{y}{x}$$

$$u = \frac{\partial \varphi}{\partial x} = U_\infty - \frac{Q}{2\pi} \left(\frac{2x}{x^2 + y^2} \right), \quad v = \frac{\partial \varphi}{\partial y} = -\frac{Q}{2\pi} \left(\frac{2y}{x^2 + y^2} \right)$$

$$\text{驻点 } u=v=0, \text{ 驻点 A 位置 } \begin{cases} y=0 \\ x = \frac{Q}{\pi U_\infty} \end{cases} \quad (0, 2.12\text{mm})$$

求 H 两种方法：

1. 过驻点 A 的流线的来流方向 $x \rightarrow -\infty$ 的高度为 H , $U_\infty H = Q, \therefore H = \frac{Q}{U_\infty} = 6.66\text{mm}$

2. 计算驻点 A $(0, \frac{Q}{\pi U_\infty})$ 所在的流线上的流函数值（A 坐标代入流函数），得到 $\psi=0$

$$y=0 \text{ 的负 } x \text{ 轴的流线方程为 } \psi = yU_\infty - \frac{Q}{\pi} \arctg \frac{y}{x} = -Q$$

$$\text{流函数之差为流量, } 0 - (-Q) = U_\infty H, \therefore H = \frac{Q}{U_\infty} = 6.66\text{mm}$$

要做一个流线型物体，其外形与无穷远来流绕 $r=a$ 圆柱流动的流场中一根流线形状相同，如图所示，问这根流线的相对圆柱对称轴的位置 $H=?$ 其上的最大速度与来流速度之比为多少？

解：可直接用基本解或基本叠加解。

$$\text{两流线之差为之间的流量 } U_\infty (H + \frac{a}{2}) [1 - \frac{a^2}{(H + \frac{a}{2})^2}] - 0 = U_\infty H, \quad \therefore H = \frac{3}{2} a$$

4. (20分) 用倾角为 θ 的皮带轮传输油料, 已知皮带轮以速度 U 匀速运动, 假设皮带轮上油膜做定常不可压缩平面流动, 坐标如图所示, 油膜厚度为 h , 环境压强为 p_0 , 油的密度为 ρ , 粘性系数 μ , 求皮带轮上油膜的速度分布, 并求出皮带轮上与油接触侧A点的应力张量。(忽略与油膜接触的空气的粘性, 重力加速度为 g)

From B.C.s and speed distribution

$$u|_{y=0} = U, \quad \tau|_{y=h} = \mu \left(\frac{du}{dy} \right) |_{y=h} = 0, \quad u = \frac{1}{2\mu} \left(\frac{dp^*}{dx} \right) y^2 + c_1 y + c_2$$

$$c_2 = U, \quad \frac{dp^*}{dx} h + \mu c_1 = 0, \quad \frac{dp^*}{dx} = -\frac{c_1 \mu}{h}, \quad c_1 = -\frac{dp^*}{dx} \cdot \frac{h}{\mu}$$

$$u = \left(\frac{1}{2\mu} y^2 - \frac{h}{\mu} y \right) \cdot \frac{dp^*}{dx} + U$$

$$\frac{dp^*}{dx} = \frac{P_A^* - P_0^*}{x} = -\frac{c_1 \mu}{h} \Rightarrow P_A^* = -\frac{c_1 \mu}{h} x + P_0^* = -\frac{c_1 \mu}{h} x + 0$$

$$P_A^* = P_A + \rho g \cdot x \sin(\theta) \Rightarrow P_A = P_A^* - \rho g \cdot x \sin(\theta) = -\frac{c_1 \mu}{h} x - \rho g \cdot x \sin(\theta)$$

$$P_{xy} = \left(\mu \frac{du}{dy} \right) |_{y=0} = \mu c_1$$

$$P = \begin{pmatrix} P_A & P_{xy} \\ P_{yx} & P_A \end{pmatrix} = \begin{pmatrix} -\frac{c_1 \mu}{h} x - \rho g \cdot x \sin(\theta) & \mu c_1 \\ \mu c_1 & -\frac{c_1 \mu}{h} x - \rho g \cdot x \sin(\theta) \end{pmatrix}$$

1. (20分) 如图所示, 已知平面均匀来流 20m/s 绕无限长钝体山坡流动, 求 (1) 坐标原点上方 B 点的高度? (2) B 点处的速度? (3) A 和 B 的压差? (4) 随着岁月沉积, 山坡高度变高到 80m (B 点也会随之变化), 问 B 点速度是增大还是减小? 为什么? (流体为理想流体, 忽略重力, 忽略植被的影响)

$$b = \frac{Q}{2\pi U_\infty}, \quad \pi b = 60 \text{ m} \Rightarrow \frac{Q}{2U_\infty} = 60 \Rightarrow Q = 2400 \text{ m}^2/\text{s}$$

Streamline at edge:

$$\psi = U_\infty r \cdot \sin(\theta) + \frac{Q}{2\pi} \theta = \pi b U_\infty$$

(1)

$$r = h_B = \frac{b(\pi - \theta)}{\sin(\theta)} = 30 \text{ m}$$

(2)

$$V_r = \frac{\partial \varphi}{\partial r} = U_\infty \cdot \cos\left(\frac{\pi}{2}\right) + \frac{Q}{2\pi r} = \frac{Q}{2\pi r} = \frac{40}{\pi} \text{ m/s} = 12.73 \text{ m/s}$$

$$V_\theta = \frac{1}{r} \left(\frac{\partial \varphi}{\partial \theta} \right) = -U_\infty \cdot \sin(\theta) = -20 \text{ m/s}$$

(3)

$$\frac{V_A^2}{2} + \frac{P_A}{\rho} + g z_A = \frac{V_B^2}{2} + \frac{P_B}{\rho} + g z_B = \frac{U_\infty^2}{2} + \frac{P_A}{\rho} = \frac{V_B^2}{2} + \frac{V_r^2}{2} + \frac{P_B}{\rho}$$

$$P_A - P_B = \rho \cdot \left(\frac{V_B^2}{2} + \frac{V_r^2}{2} - \frac{U_\infty^2}{2} \right) = \frac{\rho V_r^2}{2} = 81.03 \rho$$

(4)

$$Q = 2 \cdot (80) \cdot U_\infty = 3200 \text{ m}^2/\text{s}, \quad r = \frac{80}{\pi} \cdot \left(\frac{\pi - \frac{\pi}{2}}{\sin\left(\frac{\pi}{2}\right)} \right) = 40 \text{ m}$$

$$V_r = \frac{3200}{2\pi \cdot 40} = \frac{40}{\pi} \text{ m/s}$$

答案是不变, B 点速度与山坡高度成固定比例关系。

1. (20分) 台风可用汇和涡的叠加来模拟, 其势函数 $\Phi = -\frac{Q}{2\pi} \ln r + \frac{-\Gamma}{2\pi} \theta$, 已知

$Q = 10000 \text{ m}^3/\text{s}$, $r = 40\text{m}$ 处压强 p_1 比无穷远处压强 p_∞ 低 3000Pa , 流动是海平面密度

$\rho = 1.25 \text{ kg/m}^3$, 的理想平面不可压缩无旋流, 质量力不计, 计算:

(1) 点涡强度 Γ ; (2) $r = 20\text{m}$ 处的压强;

(3) $r = 40\text{m}$ 处流线与圆弧切线夹角 β .

(1)

$$\frac{V_1^2}{2} + \frac{P_1}{\rho} = \frac{V_\infty^2}{2} + \frac{P_\infty}{\rho} = 0 + \frac{P_\infty}{\rho}, \quad V_1 = 69.28 \frac{\text{m}}{\text{s}} = V_\theta$$

$$V_\theta = \frac{1}{r} \cdot \left(\frac{\partial \varphi}{\partial \theta} \right) = \frac{1}{r} \cdot \left(-\frac{\Gamma}{2\pi} \right) \Rightarrow \Gamma = -2\pi r \cdot V_\theta = -17411.96 \text{ m}^2/\text{s}$$

(2)

$$V_{\theta 2} = \frac{1}{r} \cdot \left(\frac{17411.96}{2\pi} \right) = \frac{1}{20} \cdot \left(\frac{17411.96}{2\pi} \right) = 138.56 \text{ m/s}$$

$$\frac{V_{\theta 2}^2}{2} + \frac{P_2'}{\rho} = \frac{V_{\theta 1}^2}{2} + \frac{P_1'}{\rho}$$

(3)

$$\theta = \frac{\pi}{2}, \quad \frac{\partial \psi}{\partial \theta} = r V_r, \quad -\frac{\partial \psi}{\partial r} = V_\theta$$

$$\beta = \tan^{-1} \left(\frac{V_r}{V_\theta} \right)$$
