

第一章习题(II)

求以下一阶线性常微分方程的解:

1.

$$\left(1 + e^{\frac{x}{y}}\right) dx + e^{\frac{x}{y}} \left(1 - \frac{x}{y}\right) dy = 0.$$

2.

$$\frac{dy}{dx} = \frac{-x + y + 1}{x + y + 5}.$$

3.

$$y' + f'(x)y = f(x)f'(x).$$

4.

$$y' = \frac{y}{2y \ln y + y - x}, \quad y > 0.$$

5.

$$f'(y)y' + p(x)f(y) = q(x),$$

这里 $f'(y)$, $p(x)$, $q(x) \in C(-\infty, +\infty)$, $y(x_0) = y_0$, $x_0 \in (-\infty, +\infty)$.

6.

$$xy'(\ln x) \sin y + \cos y(1 - x \cos y) = 0, \quad x > 0. \quad (\text{Bernoulli 方程})$$

7.

$$\frac{dy}{dx} = \frac{-x}{y} + \sqrt{1 + \left(\frac{x}{y}\right)^2}.$$

8.

$$(e^x \sin y - 2y \sin x) dx + (e^x \cos y + 2 \cos x) dy = 0. \quad (\text{全微分方程})$$

9.

$$\left(\frac{x}{\sqrt{x^2 + y^2}} + \frac{1}{x} + \frac{1}{y}\right) dx + \left(\frac{y}{\sqrt{x^2 + y^2}} + \frac{1}{y} - \frac{x}{y^2}\right) dy = 0. \quad (\text{全微分方程})$$

10.

$$x^2 y dx - (x^3 + y^3) dy = 0, \quad (\text{可化为全微分方程})$$

11.

$$y dx - (x + x^2 + y^2) dy = 0, \quad (\text{可化为全微分方程})$$

12. 利用第一次习题9的结论: 若 $y_1(x), y_2(x), y_3(x)$ 是线性一阶微分方程

$$y' = p(x)y + q(x)$$

的相异的解, 则下列等式成立:

$$\frac{y_3(x) - y_1(x)}{y_2(x) - y_1(x)} = C \text{ 常数.}$$

证明: 若 $y_k(x), k = 1, 2, 3, 4$ 是下列Riccati方程的任意四个相异解, 则其交比

$$< y_1, y_2, y_3, y_4 > =: \frac{y_4(x) - y_2(x)}{y_4(x) - y_1(x)} \cdot \frac{y_3(x) - y_1(x)}{y_3(x) - y_2(x)} = C \text{ 常数.}$$

(提示: 令 $z(x) = z_k(x) = \frac{1}{y_{k+1}(x) - y_1(x)}, k = 1, 2, 3$, 证明: $z(x) = z_k(x)$ 满足一阶线性方程:

$$z' + (2p(x)y_1(x) + q(x))z + p(x) = 0,$$

再利用第一次作业题9的结论.)
