

ODE 第九次作业

潘洪浩 2023080041 机械 34

1. 求下列初值问题的解

(1)

$$x'' + 9x = 6e^{3t}, \quad x(0) = x'(0) = 0$$

对两边取 Laplace 变换, 设 $X(s) = \mathcal{L}[x(t)]$:

$$s^2 X(s) + 9X(s) = \frac{6}{s-3}$$

$$X(s) = \frac{6}{(s-3)(s^2+9)}$$

部分分式分解:

$$\frac{6}{(s-3)(s^2+9)} = \frac{A}{s-3} + \frac{Bs+C}{s^2+9}$$

$$6 = A(s^2+9) + (Bs+C)(s-3)$$

令 $s = 3$: $6 = 18A$, 得 $A = \frac{1}{3}$ 。

比较 s^2 系数: $0 = A + B$, $B = -\frac{1}{3}$ 。

比较 s^0 系数: $6 = 9A - 3C = 3 - 3C$, $C = -1$ 。

$$X(s) = \frac{1/3}{s-3} - \frac{1}{3} \cdot \frac{s}{s^2+9} - \frac{1}{3} \cdot \frac{3}{s^2+9}$$

取逆变换:

$$x(t) = \frac{1}{3}e^{3t} - \frac{1}{3}\cos 3t - \frac{1}{3}\sin 3t$$

(2)

$$x^{(4)} + x = 2e^t, \quad x(0) = x'(0) = x''(0) = x'''(0) = 1$$

取 Laplace 变换:

$$s^4 X(s) - s^3 - s^2 - s - 1 + X(s) = \frac{2}{s-1}$$

$$(s^4 + 1)X(s) = \frac{2}{s-1} + s^3 + s^2 + s + 1$$

注意 $s^3 + s^2 + s + 1 = (s+1)(s^2+1)$, 通分:

$$(s^4+1)X(s) = \frac{2+(s-1)(s+1)(s^2+1)}{s-1} = \frac{2+(s^2-1)(s^2+1)}{s-1} = \frac{2+s^4-1}{s-1} = \frac{s^4+1}{s-1}$$

因此:

$$X(s) = \frac{s^4+1}{(s-1)(s^4+1)} = \frac{1}{s-1}$$

$$\boxed{x(t) = e^t}$$

验证: $x^{(4)} + x = e^t + e^t = 2e^t$, 初始条件均为 1, 全部满足。

2. 求解下列初值问题的解

(1)

$$\begin{cases} x_1'' + 3x_1' + 2x_1 + x_2' + x_2 = 0 \\ x_1' + 2x_1 + x_2' - x_2 = 0 \\ x_1(0) = 1, x_1'(0) = -1, x_2(0) = 0 \end{cases}$$

取 Laplace 变换, 设 $X_i(s) = \mathcal{L}[x_i(t)]$:

方程 (1):

$$s^2 X_1 - s + 1 + 3(sX_1 - 1) + 2X_1 + (sX_2) + X_2 = 0$$

$$(s^2 + 3s + 2)X_1 + (s+1)X_2 = s+2$$

$$(s+1)(s+2)X_1 + (s+1)X_2 = s+2 \quad (\text{I})$$

方程 (2):

$$sX_1 - 1 + 2X_1 + sX_2 - X_2 = 0$$

$$(s+2)X_1 + (s-1)X_2 = 1 \quad (\text{II})$$

由 (I): $(s+2)X_1 + X_2 = \frac{s+2}{s+1}$, 即 $X_2 = \frac{s+2}{s+1} - (s+2)X_1$ 。

代入 (II):

$$(s+2)X_1 + (s-1)\left[\frac{s+2}{s+1} - (s+2)X_1\right] = 1$$

$$(s+2)(2-s)X_1 + \frac{(s-1)(s+2)}{s+1} = 1$$

$$-(s^2-4)X_1 = 1 - \frac{(s-1)(s+2)}{s+1} = \frac{s+1-(s^2+s-2)}{s+1} = \frac{3-s^2}{s+1}$$

$$X_1 = \frac{s^2-3}{(s+1)(s^2-4)} = \frac{s^2-3}{(s+1)(s-2)(s+2)}$$

部分分式:

$$X_1 = \frac{2/3}{s+1} + \frac{1/12}{s-2} + \frac{1/4}{s+2}$$

$$x_1(t) = \frac{2}{3}e^{-t} + \frac{1}{12}e^{2t} + \frac{1}{4}e^{-2t}$$

求 X_2 :

$$\begin{aligned} X_2 &= \frac{s+2}{s+1} - (s+2)X_1 \\ &= \frac{s+2}{s+1} - \frac{s^2-3}{(s+1)(s-2)} \\ &= \frac{(s+2)(s-2) - (s^2-3)}{(s+1)(s-2)} \\ &= \frac{-1}{(s+1)(s-2)} \\ X_2 &= \frac{1/3}{s+1} - \frac{1/3}{s-2} \end{aligned}$$

$$x_2(t) = \frac{1}{3}e^{-t} - \frac{1}{3}e^{2t}$$

验证: $x_1(0) = \frac{2}{3} + \frac{1}{12} + \frac{1}{4} = 1$, $x_2(0) = \frac{1}{3} - \frac{1}{3} = 0$ 。

(2)

$$\begin{cases} x_1'' - m^2x_2 = 0 \\ x_2'' + m^2x_1 = 0 \\ x_1(0) = \eta_1, x_1'(0) = \eta_2, x_2(0) = \eta_3, x_2'(0) = \eta_4 \end{cases}$$

取 Laplace 变换:

$$s^2X_1 - s\eta_1 - \eta_2 - m^2X_2 = 0 \quad (\text{I}) \quad (1)$$

$$s^2X_2 - s\eta_3 - \eta_4 + m^2X_1 = 0 \quad (\text{II}) \quad (2)$$

由 (I): $X_2 = \frac{s^2X_1 - s\eta_1 - \eta_2}{m^2}$, 代入 (II):

$$\frac{s^2(s^2X_1 - s\eta_1 - \eta_2)}{m^2} - s\eta_3 - \eta_4 + m^2X_1 = 0$$

$$(s^4 + m^4)X_1 = s^3\eta_1 + s^2\eta_2 + m^2s\eta_3 + m^2\eta_4$$

同理可得:

$$(s^4 + m^4)X_2 = s^3\eta_3 + s^2\eta_4 - m^2s\eta_1 - m^2\eta_2$$

分解 $s^4 + m^4 = (s^2 + \sqrt{2}ms + m^2)(s^2 - \sqrt{2}ms + m^2)$, 令 $\alpha = \frac{m}{\sqrt{2}}$:

$$s^4 + m^4 = [(s + \alpha)^2 + \alpha^2][(s - \alpha)^2 + \alpha^2]$$

利用部分分式 (令 $P_1(s) = s^3\eta_1 + s^2\eta_2 + m^2s\eta_3 + m^2\eta_4$):

$$X_1 = \frac{P_1(s)}{(s^4 + m^4)} = \frac{As + B}{(s + \alpha)^2 + \alpha^2} + \frac{Cs + D}{(s - \alpha)^2 + \alpha^2}$$

其中系数 A, B, C, D 由 $P_1(s)$ 中的 η_i 决定。由 Laplace 逆变换:

$$x_1(t) = e^{-\alpha t}[A_1 \cos(\alpha t) + A_2 \sin(\alpha t)] + e^{\alpha t}[A_3 \cos(\alpha t) + A_4 \sin(\alpha t)]$$

$$x_2(t) = e^{-\alpha t}[B_1 \cos(\alpha t) + B_2 \sin(\alpha t)] + e^{\alpha t}[B_3 \cos(\alpha t) + B_4 \sin(\alpha t)]$$

其中 $\alpha = \frac{m}{\sqrt{2}}$, 常数 A_i, B_i 由初始条件 $\eta_1, \eta_2, \eta_3, \eta_4$ 确定。

3. 求下面函数的 Laplace 变换

(1)

$$f(t) = \begin{cases} 0, & t < 2 \\ (t - 2)^2, & t \geq 2 \end{cases}$$

可写成 $f(t) = u(t - 2) \cdot (t - 2)^2$, 由延迟性质:

$$\mathcal{L}[f(t)] = e^{-2s} \cdot \mathcal{L}[t^2] = e^{-2s} \cdot \frac{2}{s^3}$$

$$\boxed{F(s) = \frac{2e^{-2s}}{s^3}}$$

(2)

$$f(t) = \begin{cases} 0, & t < \pi \\ t - \pi, & \pi \leq t < 2\pi \\ 0, & t \geq 2\pi \end{cases}$$

利用阶跃函数表示:

$$f(t) = (t - \pi)u(t - \pi) - (t - 2\pi)u(t - 2\pi) - \pi u(t - 2\pi)$$

验证：当 $\pi \leq t < 2\pi$ 时， $f = (t - \pi) - 0 - 0 = t - \pi$ ；当 $t \geq 2\pi$ 时， $f = (t - \pi) - (t - 2\pi) - \pi = 0$ 。

$$\mathcal{L}[f(t)] = e^{-\pi s} \cdot \frac{1}{s^2} - e^{-2\pi s} \cdot \frac{1}{s^2} - \pi \cdot \frac{e^{-2\pi s}}{s}$$

$$F(s) = \frac{e^{-\pi s}}{s^2} - \frac{e^{-2\pi s}}{s^2} - \frac{\pi e^{-2\pi s}}{s}$$

4. 证明

设 $F(s) = \mathcal{L}[f(t)]$ ，当 $s > a \geq 0$ 时存在。

(1) 若 $c > 0$ ，证明 $\mathcal{L}[f(ct)] = \frac{1}{c}F\left(\frac{s}{c}\right)$

证明：令 $u = ct$ ， $du = c dt$ ：

$$\mathcal{L}[f(ct)] = \int_0^\infty e^{-st} f(ct) dt = \frac{1}{c} \int_0^\infty e^{-(s/c)u} f(u) du = \frac{1}{c}F\left(\frac{s}{c}\right)$$

当 $s > ca$ 时， $s/c > a$ ，积分收敛。□

(2) 若 $k > 0$ ，证明 $\mathcal{L}^{-1}[F(ks)] = \frac{1}{k}f\left(\frac{t}{k}\right)$

证明：在 (1) 中令 $c = 1/k$ （因 $k > 0$ ）：

$$\mathcal{L}\left[f\left(\frac{t}{k}\right)\right] = k F(ks)$$

两边取逆变换：

$$\mathcal{L}^{-1}[F(ks)] = \frac{1}{k}f\left(\frac{t}{k}\right) \quad \square$$

(3) 若 a, b 为常数且 $a > 0$ ，证明 $\mathcal{L}^{-1}[F(as + b)] = \frac{1}{a}e^{-bt/a}f\left(\frac{t}{a}\right)$

证明：由 (2)，令 $k = a$ ：

$$\mathcal{L}^{-1}[F(as)] = \frac{1}{a}f\left(\frac{t}{a}\right)$$

又 $F(as + b) = F(a(s + b/a))$ 。设 $G(s) = F(as)$ ，则 $F(as + b) = G(s + b/a)$ 。由频移性质 $\mathcal{L}^{-1}[G(s + b/a)] = e^{-bt/a}g(t)$ ，其中 $g(t) = \mathcal{L}^{-1}[G(s)] = \frac{1}{a}f\left(\frac{t}{a}\right)$ 。

故：

$$\mathcal{L}^{-1}[F(as + b)] = \frac{1}{a}e^{-bt/a}f\left(\frac{t}{a}\right) \quad \square$$

5. 求解常微分方程初值问题

$y'' + 4y = g(t)$, $y(0) = y'(0) = 0$, 其中

$$g(t) = \begin{cases} 0, & 0 \leq t < 5 \\ \frac{1}{5}(t-5), & 5 \leq t < 10 \\ 1, & t \geq 10 \end{cases}$$

用阶跃函数表示 $g(t)$:

$$g(t) = \frac{1}{5}(t-5)u(t-5) - \frac{1}{5}(t-10)u(t-10)$$

取 Laplace 变换:

$$G(s) = \frac{1}{5} \cdot \frac{e^{-5s}}{s^2} - \frac{1}{5} \cdot \frac{e^{-10s}}{s^2}$$

方程取 Laplace 变换: $(s^2 + 4)Y(s) = G(s)$, 故

$$Y(s) = \frac{1}{5} \left[\frac{e^{-5s}}{s^2(s^2 + 4)} - \frac{e^{-10s}}{s^2(s^2 + 4)} \right]$$

部分分式:

$$\frac{1}{s^2(s^2 + 4)} = \frac{1}{4s^2} - \frac{1}{4(s^2 + 4)}$$

$$\mathcal{L}^{-1} \left[\frac{1}{s^2(s^2 + 4)} \right] = \frac{t}{4} - \frac{\sin 2t}{8}$$

由延迟定理:

$$\boxed{y(t) = \frac{1}{20}(t-5)u(t-5) - \frac{1}{40}\sin 2(t-5)u(t-5) - \frac{1}{20}(t-10)u(t-10) + \frac{1}{40}\sin 2(t-10)u(t-10)}$$

6. 求解常微分方程初值问题

(1)

$y'' + 2y' + 2y = \delta(t - \pi)$, $y(0) = 1$, $y'(0) = 0$

取 Laplace 变换:

$$s^2Y - s + 2(sY - 1) + 2Y = e^{-\pi s}$$

$$(s^2 + 2s + 2)Y = e^{-\pi s} + s + 2$$

其中 $s^2 + 2s + 2 = (s+1)^2 + 1$ 。

$$Y = \frac{e^{-\pi s}}{(s+1)^2 + 1} + \frac{s+1}{(s+1)^2 + 1} + \frac{1}{(s+1)^2 + 1}$$

逆变换:

$$y(t) = e^{-t}(\cos t + \sin t) + u(t - \pi) \cdot e^{-(t-\pi)} \sin(t - \pi)$$

因 $\sin(t - \pi) = -\sin t$:

$$\boxed{y(t) = e^{-t}(\cos t + \sin t) - u(t - \pi) e^{-(t-\pi)} \sin t}$$

(2)

$$y'' + 2y' + 3y = \sin t + \delta(t - 3\pi), \quad y(0) = y'(0) = 0$$

取 Laplace 变换:

$$(s^2 + 2s + 3)Y = \frac{1}{s^2 + 1} + e^{-3\pi s}$$

其中 $s^2 + 2s + 3 = (s + 1)^2 + 2$ 。

$$Y = \frac{1}{(s^2 + 1)[(s + 1)^2 + 2]} + \frac{e^{-3\pi s}}{(s + 1)^2 + 2}$$

对第一项部分分式:

$$\begin{aligned} \frac{1}{(s^2 + 1)(s^2 + 2s + 3)} &= \frac{-\frac{1}{4}s + \frac{1}{4}}{s^2 + 1} + \frac{\frac{1}{4}(s + 1)}{(s + 1)^2 + 2} \\ &= \frac{1}{4} \cdot \frac{1}{s^2 + 1} - \frac{1}{4} \cdot \frac{s}{s^2 + 1} + \frac{1}{4} \cdot \frac{s + 1}{(s + 1)^2 + 2} \end{aligned}$$

逆变换:

$$\mathcal{L}^{-1} \left[\frac{1}{(s^2 + 1)(s^2 + 2s + 3)} \right] = \frac{1}{4}(\sin t - \cos t) + \frac{1}{4}e^{-t} \cos(\sqrt{2}t)$$

对第二项, 由延迟定理:

$$\mathcal{L}^{-1} \left[\frac{e^{-3\pi s}}{(s + 1)^2 + 2} \right] = u(t - 3\pi) \cdot \frac{1}{\sqrt{2}} e^{-(t-3\pi)} \sin[\sqrt{2}(t - 3\pi)]$$

合并:

$$\boxed{y(t) = \frac{1}{4}(\sin t - \cos t) + \frac{1}{4}e^{-t} \cos(\sqrt{2}t) + \frac{1}{\sqrt{2}}u(t - 3\pi) e^{-(t-3\pi)} \sin[\sqrt{2}(t - 3\pi)]}$$
