

$$Q3 \quad \begin{cases} \frac{dy}{dx} = x^2 - y^2, & R: |x+1| \leq 1, |y| \leq 1 \\ y(-1) = 0: \text{初始值} \end{cases}$$

解存在区间 (2) $x_0 = -1, |x - (-1)| \leq 1$
 $|x - x_0| \leq a, \therefore a = 1$

$y_0 = 0, |y - 0| \leq 1$

$|y - y_0| \leq b, \therefore b = 1$

$M := \max_{x, y \in R} |f(x, y)|$

$f(x, y) = x^2 - y^2, |x+1| \leq 1, \therefore -2 \leq x \leq 0$
 $0 \leq x^2 \leq 4$

$|y| \leq 1, \therefore -1 \leq y \leq 1,$

$0 \leq y^2 \leq 1$

$\therefore M = \max |f(x, y)| = \max |x^2 - y^2|$
 $= 4 - 0 = 4, \therefore M = 4$

M 作用, 存在区间 h,

$h = \min(a, \frac{b}{M})$

$= \min(1, \frac{1}{4}) = \frac{1}{4}$

$\therefore$ Picard 定理

$y(x) = y_0 + \int_{x_0}^x f(t, y(t)) dt$

$= 0 + \int_{-1}^x (t^2 - 0) dt$

$= \left[\frac{1}{3} t^3 \right]_{-1}^x$

$= \frac{1}{3} x^3 + \frac{1}{3}$

t : 同变量
 x : 上下限

$|x+1| \leq \frac{1}{4}$

$y(x) = \frac{1}{3} x^3 + \frac{1}{3}$

误差估计: $\frac{1}{24}$

Prove

(2) $y(x) = y_0 + \int_{x_0}^x [t^2 - y(t)^2] dt$
 $= y_0 + \int_{-1}^x (t^2 - (\frac{1}{3} t^3 - \frac{1}{3})) dt$

$y(x) = -\frac{1}{63} x^7 - \frac{1}{10} x^4 - \frac{1}{3} x^3$
 $-\frac{1}{9} x + \frac{11}{42}$

2. 验证 Lipschitz

$f(x, y) = x^2 - y^2, \frac{\partial f}{\partial y} = -2y$

$|y| \leq 1, L = \max |-2y| = 2$

存在区间误差估计

$|x - x_0| \leq h = \frac{1}{4}$

$|y(x) - y_n(x)| \leq \frac{ML^n}{(n+1)!} h^{n+1}$

$M = 4$

$L = 2$

$h = \frac{1}{4}$

$|y(x) - y_n(x)| \leq \frac{M}{L} \cdot \frac{(Lh)^3}{3!}$
 $\leq \frac{4}{2} \cdot \left(\frac{12 \cdot \frac{1}{4}}{6} \right)^3$
 $\leq \frac{1}{24}$

Q5

设 \$f(x, y)\$ 在矩形区域 \$D: \alpha \leq x \leq \beta, -\infty < y < +\infty\$ 连续, \$y\$ 满足利普希茨条件

$$\begin{cases} f(x, y) \text{ 连续}, & \alpha \leq x \leq \beta, -\infty < y < +\infty \\ y(x_0) = y_0, & x_0 \in [\alpha, \beta] \end{cases}$$

Gronwall Ineq. (唯一性)

设该区间内存在 \$y_1(x), y_2(x)\$

$$|y_1(x) - y_2(x)| = \left| \int_{x_0}^x [f(t, y_1(t)) - f(t, y_2(t))] dt \right|$$

$$\Rightarrow \text{Lipschitz } |y_1(x) - y_2(x)| \leq \int_{x_0}^x |f(t, y_1(t)) - f(t, y_2(t))| dt \leq L \int_{x_0}^x |y_1(t) - y_2(t)| dt$$

\$\therefore\$ Gronwall Ineq.

非负连续函数被自身包围且初值为 0, 该函数恒为 0.

2. Picard 迭代

$$y_0(x) = y_0$$

$$y_{n+1}(x) = y_0 + \int_{x_0}^x f(t, y_n(t)) dt, \quad y_0 \in -\infty, +\infty$$

$$M = \max_{x \in [\alpha, \beta]} |f(x, y_0)|$$

(归纳)

$$\textcircled{1} |y_1(x) - y_0(x)| \leq M|x - x_0|$$

$$\textcircled{2} |y_2(x) - y_1(x)| \leq \frac{ML}{2!} |x - x_0|^2$$

$$\dots \textcircled{n} |y_n - y_{n-1}| \leq \frac{ML^{n-1}}{n!} |x - x_0|^n$$

判定一致收敛

$$\sum_{n=1}^{\infty} \frac{ML^{n-1}}{n!} (\beta - \alpha)^n, \text{ 此级数为正项级数}$$

$$= \frac{M}{L} (e^{L(\beta - \alpha)} - 1)$$

$$f(x, y) \Rightarrow f(t, y(t))$$

Weierstrass-M 判别法

Picard \$\{y_n(x)\}\$ 在 \$x \in [\alpha, \beta]\$ 一致收敛于 \$y(x)\$

一致收敛于 \$y(x)\$

收敛

① $f(x, y)$, (x_0, y_0) 邻域内关于 y 不是增函数

① x 固定, $y_1 \geq y_2$, $f(x, y_1) \leq f(x, y_2)$. 则 $\frac{dy}{dx} = f(x, y)$

按心: 单调不增性 $\Rightarrow$ 解的唯一性

② (反证法) 设 $x \geq x_0$, 邻域内, 存在两个不同的解 $y_1(x), y_2(x)$

$$y_1(x_0) = y_2(x_0) = y_0$$

③ 构造 $z(x) = y_1(x) - y_2(x)$,
 $z(x_0) = y_1(x_0) - y_2(x_0) = 0$

$$\textcircled{3} \quad \frac{dz}{dx} = \frac{dy_1}{dx} - \frac{dy_2}{dx} = f(x, y_1) - f(x, y_2)$$

④ 固定 x , $y_1 \geq y_2$ $f(x, y_1) \leq f(x, y_2)$

分类讨论: ① $z(x) > 0$, ($= y_1 > y_2$), 根据不增性 $f(x, y_1) \leq f(x, y_2)$, $z'(x) \leq 0$
 ② $z(x) < 0$, ($= y_1 < y_2$), $f(x, y_1) \geq f(x, y_2)$ $z'(x) \geq 0$

⑤ 假设 $x > x_0$, $y_1(x) > y_2(x)$. 即 $z(x) > 0$

$$\therefore z(x_0) = y_1(x_0) - y_2(x_0) = 0, \text{ 且 } z(x) > 0 \text{ 且 } \forall x \in [x_0, x_1]$$

根据④ $z(x) > 0 \Rightarrow z'(x) \leq 0$, $z(x)$ 严格递减
 $z(x) > 0$

矛盾: $z(x)$ 起值为 0, 在 $x > 0$ 严格递减连续, 不可能

$\therefore x > x_0$, $z(x) \equiv 0$, $y_1(x) \equiv y_2(x)$. $x > x_0$ 情况下解唯一

✱

Q. 设 $f(x)$ 在 $(-\infty, \infty)$ 上定义, 满足

$$|f(x_1) - f(x_2)| \leq N |x_1 - x_2|, \quad 0 \leq N < 1$$

$x_1 = f(x_0) \quad x_2 = f(x_1)$

(反证法) 设 x_1, x_2 为方程两根

① 唯一性 $x_1 = f(x_1), x_2 = f(x_2)$

$$|x_1 - x_2| = |f(x_1) - f(x_2)|$$

从而 $|x_1 - x_2| \leq N |x_1 - x_2|$

$$(1-N) |x_1 - x_2| \leq 0$$

由于满足 $N < 1$, $\therefore (1-N) > 0$,

使上述 $(1-N) |x_1 - x_2| \leq 0$ 不等式成立, $|x_1 - x_2| = 0, x_1 = x_2$

$\Rightarrow$ 解若存在, 必是唯一的

1) 存在性

(a) 构造序列 $\{x_n\}$: $x_0 = x_0$
 $x_{n+1} = f(x_n)$

(b) 相邻项差 $|x_2 - x_1| = |f(x_1) - f(x_0)| \leq N |x_1 - x_0|$

$$|x_3 - x_2| = |f(x_2) - f(x_1)| \leq N |x_2 - x_1| \leq N^2 |x_1 - x_0|$$

从而 $\{x_n\}$ 为 Cauchy 列 $\forall m > n$ $|x_{n+1} - x_n| \leq N^n |x_1 - x_0|$

$$|x_m - x_n| \leq |x_m - x_{m-1}| + \dots + |x_{n+1} - x_n|$$

$$|x_m - x_n| \leq (N^{m-1} + \dots + N^n) |x_1 - x_0| = N^n \left(\frac{1 - N^{m-n}}{1 - N} \right) |x_1 - x_0|$$

$0 \leq N < 1, n \rightarrow \infty, N^n \rightarrow 0$. $\{x_n\}$ 满足 $\lim_{n \rightarrow \infty} x_n = x_1$ 收敛

$f(x)$ 满足 Lipschitz 条件 $\Rightarrow$ 过程, $x_{n+1} = f(x_n), x_1 = f(x_0)$

$$\text{Q1 } \varphi(x) = f(x) + \lambda \int_a^b K(x, \xi) \varphi(\xi) d\xi$$

$f(x)$ 在 $[a, b]$ 连续, $K(x, \xi)$ 在 $[a, b] \times [a, b]$ 连续

证 $|\lambda|$ 足够小 存在唯一连续解 $\varphi(x)$

① $K(x, \xi)$, 同正连续, 有界连续, 存在最大值

$$M = \max_{x, \xi \in [a, b]} |K(x, \xi)|,$$

$$h(\text{区间长度}) = b - a$$

② 定义 $\{\varphi_n(x)\}$ 序列

$$\text{st. } \varphi_0(x) = f(x) \quad \varphi_{n+1}(x) = f(x) + \lambda \int_a^b K(x, \xi) \varphi_n(\xi) d\xi$$

$$\text{③ } \|\varphi_n - \varphi_{n-1}\| = \max | \varphi_n(x) - \varphi_{n-1}(x) | \quad (\text{为最大模范数})$$

$$| \varphi_{n+1}(x) - \varphi_n(x) | = \left| \lambda \int_a^b K(x, \xi) [\varphi_n(\xi) - \varphi_{n-1}(\xi)] d\xi \right|$$

绝对值不等式放大: $|ab| \leq |a||b|$, a, b 为函数

$$| \varphi_{n+1}(x) - \varphi_n(x) | \leq |\lambda| \int_a^b |K(x, \xi)| \cdot | \varphi_n(\xi) - \varphi_{n-1}(\xi) | d\xi$$

代入 M 乘区间长度 h ,

$$| \varphi_{n+1}(x) - \varphi_n(x) | \leq |\lambda| M h | \varphi_n - \varphi_{n-1} |$$

在区间上

$$\text{④ } N = |\lambda| M (b - a)$$

$$|\lambda| < \frac{1}{M(b-a)}, \quad N < 1, \quad | \varphi_{n+1} - \varphi_n | \leq N | \varphi_n - \varphi_{n-1} |$$

⑤ 唯一性 若存在 Φ_1, Φ_2 两解,

$$\text{也 } | \Phi_1 - \Phi_2 | \leq N | \Phi_1 - \Phi_2 |$$

由 $N < 1$, 得 $\|\Phi_1 - \Phi_2\| = 0$, $\{\Phi_n\}$ 收敛
